ABSTRACT:

PROBLEM TO BE SOLVED: To allow a user to recognize the end of data reception even when the user leaves a radio terminal station during data communication in the radio communications system consisting of a control station that controls the entire system and contains at least one public line and at least one radio terminal station radio-controlled by the control station.

SOLUTION: In the case that a kind of an incoming call from a public network is detected and the detection indicates the kind of the incoming call to be radio data communication, data communication with a radio

terminal station 107  
is conducted. When the end of the radio data communication  
is detected, a  
display device is used to inform of the end of the radio  
data communication.  
The presence of the end notice when the radio data  
communication is finished is  
controlled by a control station 103, the radio terminal  
station 107, a radio  
telephone set 104 or the like.
